NEW RELEASE ANNOUNCEMENT

Release Notes   February 2022
CloudNine LAW 7.6 and Explore 7.6

The newest release of **CloudNine LAW and Explore, version 7.7** is now available for download. Building upon the significant enhancements included in the 7.6 release, the software delivers the speed and processing you need combined with on-demand scalability, workflow efficiency and reduced resource dependency.

> **Important Notice: Among the updates listed below, CloudNine LAW versions 7.6 and above require SQL 2016 or higher.**

Release Themes for LAW 7.6 and 7.7: The new Turbo Imager module in LAW now provides the fastest, near-native imaging technology available with modern computing hardware. Combined with improvements in the advanced search, filter, and culling technologies of CloudNine Explore, users can leverage the power of both applications to increase scalability and efficiency.

New, Turbo Imager Tool for Near-Native Document Imaging

- Expedite document conversion with new Turbo Imager for near-native imaging in Turbo or ED Loader cases

- Turbo Imager will be offered together with Turbo Import licenses. For each license of Turbo Import, clients will also receive a license of Turbo Imager, or vice versa.

- Scale functionality as needed with agent-based imaging without additional resources or 3rd party software

- Produce images in original or selected time zone

- Track or cancel imaging jobs in the LAW Management Console (LMC)

Request a LAW Demo

> **USE CASE:** The demand to obtain images quickly is significant and costly to source and maintain multiple 3rd party applications. Turbo Imager enables fast image conversion within a single application without relying on additional software.

Improved Date Field Collection

- Improved metadata harvesting and detect functionality to automatically populate date fields. If metadata does not exist, date information is searched from the Parent hierarchy (or file system if no Parent exist) and populated to the files.

- Parent hierarchy searched in bottom-up order.
  FileSystem = 1
  Parent = 2
  MapiProperties = 3
  ArchiveEntry = 4
  Metadata = 5

Improved Bulk-Delete Options

- Improve performance of document deletion in cases using LAW Turbo Import.

  USE CASE: When clients need to import data quickly, they have an increased risk of mistakes and data being ingested with the wrong information. Should the need arise to reverse unintentional imports, LAW has expanded the ability to delete thousands of files in minutes using agents, in cases using Turbo Import.

Upgraded Turbo Import File Type Library

- Increase number of supported email file types including EXIF and Metadata extraction.

- Improve Email analysis (Content/body, headers, attachments, and hashing of PST/OST, MSG, Mime/eml, and ICS emails)

- Normalize language within the Turbo Import Report for greater consistency (e.g. "Import Items" are consistently called "Source Files").

  USE CASE: With multiple configuration settings for file types generated by Microsoft and other 3rd party software, the LAW library has been updated to better control the type of metadata they wish to extract and the process for how it will be extracted.

Improved LAW Management Console

- Access and display the current count of active license keys from the Console the License Manager is connected to.

![cloudnine EXPLORE logo]

Release Theme for CloudNine Explore 7.6 and 7.7: Faster access to case summaries and ability to preview data prior to export helps align expectations and billing projections for more proactive case management.

Automatic Image Detection in PDFs for OCR
- Detect and flag PDF documents containing images for OCR during analysis/processing.

Improve Report Format
- Tally file size of expected export
- Display the total of all files by count and file size (minus containers in the family) in Search Reports for both Explore Web and Desktop

Expand API Field List
- The API will now provide access to more fields thus, reducing the drill-down navigation within the application to locate desired information.

Upgrade Import Library
- Increase number of supported email file types including EXIF and Metadata extraction.
- Improve Email analysis (Content/body, headers, attachments, and hashing of PST/OST, MSG, Mime/eml, and ICS emails)

Upgrade Information for Case Migrations: After upgrading to LAW or Explore 7.6 or 7.7, the management and case databases will also require updates. Management updates can be applied through the LAW Configuration Utility or by opening LAW or Explore. Case updates can be applied by merely opening a case, and users will be prompted before the case updates are made. No work can be done on these cases while updates are pending. Inactive or legacy cases do not require updating until work on them is necessary.
